### List comprehensions

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**Data Scientist at DataCamp

#### Populate a list with a for loop

```
nums = [12, 8, 21, 3, 16]
new_nums = []
for num in nums:
    new_nums.append(num + 1)
print(new_nums)
```

```
[13, 9, 22, 4, 17]
```

#### A list comprehension

```
nums = [12, 8, 21, 3, 16]
new_nums = [num + 1 for num in nums]
print(new_nums)
```

```
[13, 9, 22, 4, 17]
```

#### For loop and list comprehension syntax

```
new_nums = [num + 1 for num in nums]

for num in nums:
    new_nums.append(num + 1)
print(new_nums)
```

```
[13, 9, 22, 4, 17]
```

#### List comprehension with range()

```
result = [num for num in range(11)]
print(result)
```

```
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

#### List comprehensions

- Collapse for loops for building lists into a single line
- Components
  - Iterable
  - Iterator variable (represent members of iterable)
  - Output expression

#### Nested loops (1)

```
pairs_1 = []
for num1 in range(0, 2):
    for num2 in range(6, 8):
        pairs_1.append(num1, num2)
print(pairs_1)
```

```
[(0, 6), (0, 7), (1, 6), (1, 7)]
```

How to do this with a list comprehension?

#### Nested loops (2)

```
pairs_2 = [(num1, num2) for num1 in range(0, 2) for num2 in range(6, 8)]
print(pairs_2)
```

```
[(0, 6), (0, 7), (1, 6), (1, 7)]
```

Tradeoff: readability

# Let's practice!

PYTHON DATA SCIENCE TOOLBOX (PART 2)

# Advanced comprehensions

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**Data Scientist at DataCamp

#### **Conditionals in comprehensions**

Conditionals on the iterable

```
[num ** 2 for num in range(10) if num % 2 == 0]

[0, 4, 16, 36, 64]
```

Python documentation on the % operator: The % (modulo) operator yields the remainder from the division of the first argument by the second.

```
5 % 2

1
6 % 2
```

#### Conditionals in comprehensions

Conditionals on the output expression

```
[num ** 2 if num % 2 == 0 else 0 for num in range(10)]

[0, 0, 4, 0, 16, 0, 36, 0, 64, 0]
```

#### Dict comprehensions

- Create dictionaries
- Use curly braces {} instead of brackets []

```
pos_neg = {num: -num for num in range(9)}
print(pos_neg)
```

```
\{0: 0, 1: -1, 2: -2, 3: -3, 4: -4, 5: -5, 6: -6, 7: -7, 8: -8\}
```

```
print(type(pos_neg))
```

```
<class 'dict'>
```

# Let's practice!

PYTHON DATA SCIENCE TOOLBOX (PART 2)

# Introduction to generator expressions

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**Data Scientist at DataCamp

#### Generator expressions

• Recall list comprehension

```
[2 * num for num in range(10)]
 [0, 2, 4, 6, 8, 10, 12, 14, 16, 18]
• Use ( ) instead of [ ]
 (2 * num for num in range(10))
<generator object <genexpr> at 0x1046bf888>
```

#### List comprehensions vs. generators

- List comprehension returns a list
- Generators returns a generator object
- Both can be iterated over

#### Printing values from generators (1)

```
result = (num for num in range(6))
for num in result:
    print(num)
result = (num for num in range(6))
print(list(result))
[0, 1, 2, 3, 4, 5]
```

#### Printing values from generators (2)

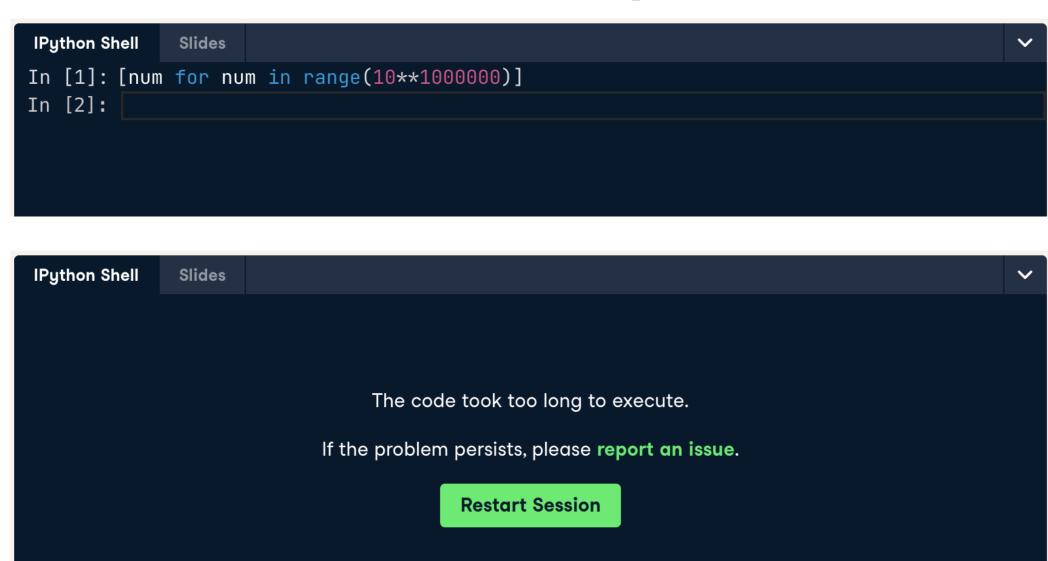

```
result = (num for num in range(6))
                                       print(next(result))
 Lazy evaluation
print(next(result))
                                       print(next(result))
print(next(result))
                                       print(next(result))
```

#### Generators vs list comprehensions

#### Generators vs list comprehensions

#### Generators vs list comprehensions

#### Conditionals in generator expressions

```
even_nums = (num for num in range(10) if num % 2 == 0)
print(list(even_nums))
```

[0, 2, 4, 6, 8]

#### **Generator functions**

- Produces generator objects when called
- Defined like a regular function def
- Yields a sequence of values instead of returning a single value
- Generates a value with yield keyword

#### Build a generator function

• sequence.py

```
def num_sequence(n):
    """Generate values from 0 to n."""
    i = 0
    while i < n:
        yield i
        i += 1</pre>
```

#### Use a generator function

```
result = num_sequence(5)
print(type(result))
<class 'generator'>
for item in result:
    print(item)
3
```

# Let's practice!

PYTHON DATA SCIENCE TOOLBOX (PART 2)

# Wrapping up comprehensions and generators.

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**Data Scientist at DataCamp

#### Re-cap: list comprehensions

Basic

[output expression for iterator variable in iterable]

#### • **advanced**

```
[output expression +
conditional on output for iterator variable in iterable +
conditional on iterable]
```

# Let's practice!
